DETD(37)

In . . . beams red (F1R), green (F1V) and blue (F1B) are processed by spatial modulators 1R, 1V, 1B. The modulated beams FMR, \*\*FMV\*\*, FMB are transmitted to a dichroic cube. The face 3R of the cube reflects the red beam FMR. The face 3B reflects the blue beam FMB. The green beam \*\*FMV\*\* goes through the cube without reflection. The three beams are therefore combined into a single beam FMT which is amplified. . .

DRWD(15)

FIG. 14 shows the reproductive scores of transgenic plants containing mutant EPSPS under the control of the \*\*FMV\*\* full-length transcript promoter (pMON996) or CaMV35S promoter (pMON899) after glyphosate application.

DETDESC:

DETD(213)

Transgenic . . . containing the Arabidopsis EPSP synthase gene containing a single glycine to alanine mutation at nucleotide 101 driven by either the \*\*FMV\*\* promoter or the CaMV35S promoter were obtained and analyzed for resistance to glyphosate. The transgenic plants containing the Arabidopsis EPSP synthase gene (as described above) directed by the \*\*FMV\*\* promoter contained pMON996, FIG. 12 and FIG. 13, while those plants containing the enhanced CaMV35S promoter contained pMON899. These transgenic. . .

DETDESC:

DETD(222)

FIG. 14 compares the reproductive scores of the total number of transgenic canola lines containing the \*\*FMV\*\* promoter with transgenic lines containing the CaMV35S promoter. As can be seen in FIG. 14, the reproductive scores of three of the seven transgenic lines containing the \*\*FMV\*\* promoter (pMON996) are better than any of the scores from lines containing the CaMV35S promoter (pMON899). In fact, the transgenic. . . used in FIG. 14 exhibit the highest levels of glyphosate tolerance among 150 lines previously tested. This demonstrates that the \*\*FMV\*\* promoter more uniformly expresses a gene product throughout the tissues and cells of the plant, and particularly in the floral. . .
